

Ecommerce – Will be a source layer.

Lakehouse

Landing – same as a source layer

raw – raw data with timestamp

Silver – add upset logic and new data will show here (compares pervious data and current data)

Gold – aggregation example: total new customers in a year.

There is a log file to show all log and can trackers.

We can access to azure storage account by access key -

Manage all permissions using service principle and user or group level access to Lakehouse.

Python code – reuse

config file
